Atlas of the Facial Nerve and Related Structures-Nobutaka Yoshioka  
2015-05-15 Nobutaka Yoshioka, MD, PhD and Albert L. Rhoton Jr., MD have created an anatomical atlas of astounding precision. An unparalleled teaching tool, this atlas opens a unique window into the anatomical intricacies of complex facial nerves and related structures. An internationally renowned author, educator, brain anatomist, and neurosurgeon, Dr. Rhoton is regarded by colleagues as one of the fathers of modern microscopic neurosurgery. Dr. Yoshioka, an esteemed craniofacial reconstructive surgeon in Japan, mastered this precise dissection technique while undertaking a fellowship at Dr. Rhotons microanatomy lab, writing in the preface that within such precision images lies potential for surgical innovation. Organized by region, each layered dissection elucidates specific nerves and structures with pinpoint accuracy, providing the clinician with in-depth anatomical insights. Precise clinical explanations accompany each photograph. In tandem, the images and text provide an excellent foundation for understanding the nerves and structures impacted by neurosurgical-related pathologies as well as other conditions and injuries. An

each step in appropriate manner cumulatively enables us to perform more complex procedures. Theme of this atlas revolves around this fact. This atlas on head and neck cancers takes a fresh stylistic approach where each surgical procedure is described in a step-wise manner through labeled high-resolution images with minimal incorporation of text. This allows the surgeons to rapidly revise the operative steps of a procedure within minutes just before they start a surgery. Head and neck has multidimensional anatomy and surgical treatment requires specific approach for each subsite. This operative atlas covers the entire spectrum of common, uncommon and rare cancers of the head and neck area. Each subsite is addressed in a separate chapter with further subdivisions for surgery of tumors with varying extent. Each procedure is demonstrated with photographs of each surgical step and line diagrams. Commonly used flaps (regional and free flaps) are demonstrated in separate chapter for reconstruction. With over 1000 images, and coverage of both the ablative and reconstructive surgical procedures, this is a technique-focused atlas in comparison to the available comprehensive texts. There are two chapters on very advanced cancers, and surgery in resource constrained surgical units making the book relevant to a wide range of cancer surgeons and fellows-in-training in varied clinical settings.

Colour Atlas of Micro-Oto-Neurosurgical Procedures-Vittorio Colletti 2013-04-17 Modern microsurgical techniques have opened up a new horizon for the otoneurosurgeon. This volume is a very important contribution to the student who is learning these surgical approaches. Surgical otoneurology has now passed the infancy stage, but is still an adolescent. As more otologists and neurosurgeons become skilled in this type of surgery, new and better approaches will evolve. Certainly there needs to be much better management of the carotid artery as it passes through the temporal bone. Better techniques to preserve the IX, X, and XI nerves in the jugular bulb area should be developed, and more delicate procedures for management of lesions inside the cochlea and vestibular labyrinth should be developed. As our diagnostic techniques have improved, particularly through imaging, surgical techniques to match the improved diagnostic techniques will emerge. For future otoneurologists who are prepared, many problems involving the temporal bone that are now considered untreatable will be successfully managed for very grateful patients. The purpose of this text is to familiarize the otoneurosurgeon with the anatomy of the temporal bone, skull base, infratemporal fossa, and cerebellopontine angle. This anatomy will be taught by demonstrating surgical procedures. This atlas which is ~~downloaded from~~

of cooperation between the schools of Los Angeles and Verona will permit the reader to rehearse otoneurosurgical procedures in the laboratory, and, when the techniques have been mastered, apply the various approaches in the treatment of inner ear and skull base lesions. William F. House MD.
